

Multiplication

Year 1	Year 2	Year 3
<u>Mental Strategies</u> Children should experience regular counting on and back from different numbers in 1s and in multiples of 2, 5 and 10. Children should memorise and reason with numbers in 2, 5 and 10 times tables They should see ways to represent odd and even numbers. This will help them to understand the pattern in numbers.  Children should begin to understand multiplication as scaling in terms of double and half. (e.g. that tower of cubes is double the height of the other tower) <u>Vocabulary</u> Ones, groups, lots of, doubling repeated addition groups of, lots of, times, columns, rows longer, bigger, higher etc times as (big, long, wide ...etc) <u>Generalisations</u> Understand 6 counters can be arranged as 3+3 or 2+2+2 Understand that when counting in twos, the numbers are always even. <u>Some Key Questions</u> Why is an even number an even number? What do you notice? What's the same? What's different? Can you convince me? How do you know?	<u>Mental Strategies</u> Children should count regularly, on and back, in steps of 2, 3, 5 and 10. Concrete apparatus and images should continue to be used to support thinking. Children should practise times table facts $2 \times 1 =$ $2 \times 2 =$ $2 \times 3 =$ Use a clock face to support understanding of counting in 5s. Use money to support counting in 2s, 5s, 10s, 20s, 50s <u>Vocabulary</u> multiple, multiplication array, multiplication tables / facts groups of, lots of, times, columns, rows <u>Generalisation</u> Commutative law shown on array (video) Repeated addition can be shown mentally on a number line Inverse relationship between multiplication and division. Use an array to explore how numbers can be organised into groups. <u>Some Key Questions</u> What do you notice? What's the same? What's different? Can you convince me? How do you know?	<u>Mental Strategies</u> Children should continue to count regularly, on and back, now including multiples of 4, 8, 50, and 100, and steps of 1/10. The number line should continue to be used as an important image to support thinking, and the use of informal jottings and drawings to solve problems should be encouraged. Children should practise times table facts $3 \times 1 =$ $3 \times 2 =$ $3 \times 3 =$ <u>Vocabulary</u> partition grid method inverse short multiplication <u>Generalisations</u> Connecting x2, x4 and x8 through multiplication facts Comparing times tables with the same times tables which is ten times bigger. If $4 \times 3 = 12$, then we know $4 \times 30 = 120$. Use place value counters to demonstrate this. When they know multiplication facts up to x12, do they know what x13 is? (i.e. can they use 4×12 to work out 4×13 and 4×14 and beyond?) <u>Some Key Questions</u> What do you notice? What's the same? What's different? Can you convince me? How do you know?
